

THE CHAMPION
of TREES

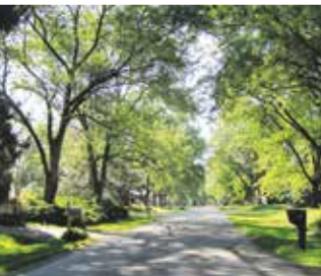

NORTHERN ILLINOIS TREE SPECIES LIST

Indian Summer crabapple, *Malus 'Indian Summer'*

Introduction to The Morton Arboretum

Northern Illinois Tree Species List

Trees well suited to the conditions of their sites will be healthier and more likely to succeed and will require fewer resources for care and maintenance. This list describes trees that grow well in northern Illinois, with recommendations on best planting sites for each species.

Selecting the best tree species for your site is vital to the success of your tree planting.

Importance of diversity in the landscape

In the ongoing wake of ash tree destruction by the emerald ash borer, it's vital to recognize the impact of relying so heavily on one genus, ash, just as communities did in the 1950s with elms that were later lost to Dutch elm disease. We have the opportunity now, while replacing lost ash trees, to consider the value of diversity in tree selections. We can fortify communities against impacts from future invasions and a changing climate by increasing the diversity of the trees we plant. Increased diversity also provides a wider variety of food and shelter for wildlife and many other ecosystem services (such as carbon sequestration, storm water absorption, and nutrient cycling).

Strategies for increasing diversity in your community

- 💡 Pay attention to the trees commonly planted in your neighborhood and choose something different. For example, maple trees are the most common genus planted in many neighborhoods. If you live in one of those neighborhoods, browse our list for other trees that will suit your planting site.
- 🎯 Aim for the 5-10-15 guideline (up to 5 percent of any one species, up to 10 percent of any one genus, and up to 15 percent of any one family). This guideline is especially useful for incorporation into tree management plans.
- ✓ Select trees to suit the planting site. Consider the soil type, sun exposure, and site limitations (such as power lines, high exposure to salt spray). The variability in sites is best answered with a variety in tree selections.

For more information about each species, check The Morton Arboretum website at mortonarb.org/tree-selector.

Key to the list

Planting Sites

Y=Yes, **N**=No, **U**=Uncertain

City Parkway – Usually publicly controlled property adjacent and parallel to the roadway. Typically have high exposure to stressors (road pollutants, limited soil volume, poor drainage, or dry soils). Widths vary.

Median – Land in the center of a roadway. Typically have highest exposure to stressors (road pollutants, limited soil volume, dry soils), though medians come in many shapes and sizes. Medians can be acceptable places to plant trees with thorns.

Restricted Sites – Openings in sidewalks and other pavements without soil under the pavement to support root growth. Although some trees tolerate restricted planting sites, growth will be restricted within 20 years unless there is at least 200 square feet of open soil around them. Smaller spaces will reduce growth sooner and to a greater extent.

Residential and Parks – Open parcels of land, including commercial and industrial campuses. Typically have regular maintenance and fewer stressors than other urban sites.

Under Utility Lines – Only plant trees with mature heights up to 25 feet.

Considerations

Key species traits should be considered before making your final species selection. For example, trees with thorns, such as hawthorn, may not be a good choice in areas where children play.

I= Commonly planted in the Chicago region. To avoid overplanting one species, check tree composition near you.

A= Aggressive. Capable of spreading quickly.

M= Messy. From fruit or other plant parts.

R= Resistant to particular serious insects and diseases.

BBB= Bronze birch borer

DED= Dutch elm disease

S= Sewer. Roots prone to invading sewer pipes.

T= Thorns. For safety, be aware of thorns.

Performance Limitations

Key species traits may inhibit the performance of your tree unless sited carefully.

For example, trees that are marginally hardy will need sheltered sites and may require additional maintenance in winter. Possible traits in this category are:

I= Prone to major pests and diseases.

EAB = Emerald ash borer

TCD = Thousand cankers disease

2= Weak wood and branch structure.

3= Highly susceptible to ice storm damage.

4= Excessive sucker growth can be a problem.

5= Intolerant of polluted soil and/or air.

6= May be difficult to find in nurseries.

7= Marginally hardy.

Cultivars Available?

Y= Yes, **N**= No

A cultivar is a named plant selection from which identical or near-identical plants can be produced. An example is Accolade® elm. Vegetative reproduction or cloning is the propagation method most frequently used. Often many cultivars are selected from a single species. There are too many cultivars available to be listed individually in this guide, but selected cultivars have been included as highlights.

Native to Illinois

Y=Yes, **N**=No

Species that are native to Illinois are typically well-suited to this climate, while also providing food and shelter for native wildlife.

Mature Height

Select a tree of appropriate size for your space.

Compact (10–15 ft.) and **Small (15–25 ft.)** trees are suitable for planting under utility lines, among other locations.

Medium (25–40 ft.) trees can be used in many locations.

Large (>40 ft.) trees are often best in large yards or park-like spaces.

Mature Width

Width given is typical of tree when planted in an appropriate site.

Growth Rate in First 10 Years

Trees typically have a faster growth rate in the first 10 years of their lives and a slower rate as they become more established in a site. The growth rates on this list are estimates and can be affected by growing conditions, including weather and appropriateness of planting site. Note that fast-growing trees often have shorter life spans and weaker branches. Possible traits in this category are:

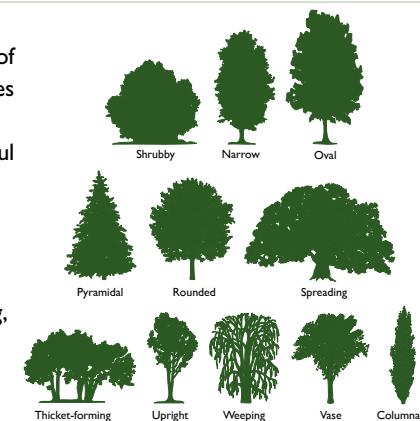

Slow (less than 10 in. per year), Moderate (10 to 20 in. per year), and **Fast (more than 20 in. per year).**

Light Required

○= Full sun, **I**= Partial shade, **●**= Full shade

Form

The height, width, and branching pattern of a tree are important. Small, spreading trees are not appropriate near streets where visibility is important, but can be very useful when screening is desired. On a site with many trees, a mixture of forms can be aesthetically pleasing. Possible forms: **shrubby, narrow, oval, pyramidal, rounded, spreading, thicket-forming, upright, weeping, vase, columnar.**

Ideal Digging Season

Trees can be purchased in many forms—bare root, container, grow bag, or ball-and-burlap. Ball-and-burlap (B&B) trees are dug out of nurseries and wrapped in burlap for transport. Some species perform best after transplanting if they are dug in the spring.

Tolerances

Understanding site limitations is important when selecting a tree species. For example, while urban soils in northern Illinois are often alkaline, pin oaks require acidic soil. Deicing salt can cause stress and death to certain species planted near busy roads. Testing your soil and observing your site's conditions before you select a tree can help you avoid expensive mistakes. (For a list of soil testing facilities, visit: urbanext.illinois.edu/soiltest.) Possible traits in this category are:

T=Tolerant

M=Moderate

I=Intolerant

P=Prefers

R=Requires

U=Uncertain

Ornamental Interest

Many plants have especially attractive features or seasonal interest. On this list we focus on winter interest (**bark, form, or persistent fruit**); flowers (**fragrant, showy, striking, spring, summer, or fall**); fruit or cones (**edible, ornamental, showy, striking, or variable**); whether a tree is evergreen or deciduous; and whether a tree has fall color.

For more details on the ornamental features of these species, visit mortonarb.org/tree-selector.

Trees Not Recommended Due to Pests, Diseases, or Invasiveness

The following trees are **not recommended** for planting anywhere in this region and usually require removal and/or replacement. To find more details about these species, visit the Northern Illinois Tree Selector at mortonarb.org/tree-selector.

Common Name	Botanical Name	Pest/Disease/Invasive
Norway maple	<i>Acer platanoides</i>	Invasive
Tree of heaven	<i>Ailanthus altissima</i>	Invasive
European white birch	<i>Betula pendula</i>	Bronze birch borer
Asian white birch	<i>Betula platyphylla</i>	Bronze birch borer
White ash	<i>Fraxinus americana</i>	Emerald ash borer
European ash	<i>Fraxinus excelsior</i>	Emerald ash borer
Black ash	<i>Fraxinus nigra</i>	Emerald ash borer
Green ash	<i>Fraxinus pennsylvanica</i>	Emerald ash borer
Pumpkin ash	<i>Fraxinus profunda</i>	Emerald ash borer
Blue ash	<i>Fraxinus quadrangulata</i>	Emerald ash borer
Butternut	<i>Juglans cinerea</i>	Butternut canker
Austrian pine	<i>Pinus nigra</i>	Not suitable for region, becomes susceptible to many pests and diseases
Scots pine	<i>Pinus sylvestris</i>	Not suitable for region, becomes susceptible to many pests and diseases
Black poplar, includes cultivar 'Italica'	<i>Populus nigra</i>	Canker
Callery pear	<i>Pyrus calleryana</i>	Invasive
Buckthorn	<i>Rhamnus cathartica</i>	Invasive
Dahurian buckthorn	<i>Rhamnus davurica</i>	Invasive
Siberian elm	<i>Ulmus pumila</i>	Invasive
Slippery elm	<i>Ulmus rubra</i>	Dutch elm disease

Notes

OUR MISSION

The mission of The Morton Arboretum
is to collect and study trees, shrubs,
and other plants from around the world,
to display them across naturally beautiful landscapes for
people to study and enjoy,
and to learn how to grow them
in ways that enhance our environment.

Our goal is to encourage
the planting and protection of trees
and other plants for
a greener, healthier, and more beautiful world.
